

They have big, sharp teeth, long eel-like bodies, and they look like they could bite your fingers right off—but divers can pet them. They're Wolffish, and Jonathan visits both Atlantic and Pacific species with a journey from Eastport, Maine to Port Hardy, British Columbia. You won't believe the amazing encounters he has with these docile but mean-looking fish.

Objectives

- 1. Introduces viewers to Atlantic and Pacific species of wolffish.
- 2. Highlights the cold water habitats for wolffish.
- 3. Illustrates nesting and how male wolffish guard their eggs.

Questions for before watching the program

- 1. What is an eel? What is a fish? How do you tell them apart?
- 2. Do fish make nests? Why might a fish make a nest?
- 3. Are fish dangerous? Does a "Wolffish" sound like a dangerous animal?

Discussion for after watching the program

- 1. Internet research: what is the difference between an eel and a true fish? How can you tell them apart?
- 2. The Pacific wolffish is often called a "wolf eel." Which is it, an eel or a fish? Why?
- 3. Adult and juvenile wolffish are different colors. What benefit might this have?
- 4. Wolffish seem docile to divers, but they have fearsome-looking teeth. What are the teeth for?
- 5. Wolffish don't look anything like wolves so why are they likely called wolffish?
- 6. Wolffish live in a den. Why might that be?
- Wolffish are often considered dangerous to fishermen, but they are very docile to divers. Why the differing characterizations?
